

# Introduction: Fundamentals

# CONTENTS

- What is a digital image?
- What is digital image processing?
- History of digital image processing
- Steps in digital image processing

# WHAT IS A DIGITAL IMAGE?

A digital image is a representation of a two-dimensional image as a finite set of digital values, called picture elements or pixels

## Common image formats include:

- 1 sample per point (B&W or Grayscale)
- 3 samples per point (Red, Green, and Blue)
- 4 samples per point (Red, Green, Blue, and “Alpha”, a.k.a. Opacity)

For most of this presentation we will focus on grayscale images.

- What is Digital Image Processing?

### Digital Image

— a two-dimensional function  $f(x, y)$

$x$  and  $y$  are spatial coordinates

The amplitude of  $f$  is called intensity or gray level at the point  $(x, y)$

### Digital Image Processing

— process digital images by means of computer, it covers low-, mid-, and high-level processes

low-level: inputs and outputs are images

mid-level: outputs are attributes extracted from input images

high-level: an ensemble of recognition of individual objects

The continuum from image processing to computer vision can be broken up into low-, mid- and high-level processes

Pixel values typically represent gray levels, colours, heights, opacities etc

Remember *digitization* implies that a digital image is an *approximation* of a real scene

# A Simple Image Formation Model

$$f(x, y) = i(x, y) \square r(x, y)$$

$f(x, y)$ : intensity at the point  $(x, y)$

$i(x, y)$ : illumination at the point  $(x, y)$

(the amount of source illumination incident on the scene)

$r(x, y)$ : reflectance/transmissivity at the point  $(x, y)$

(the amount of illumination reflected/transmitted by the object)

where  $0 < i(x, y) < \infty$  and  $0 < r(x, y) < 1$

Weeks 1 & 2

# HISTORY OF DIGITAL IMAGE PROCESSING

Early 1920s: One of the first applications of digital imaging was in the newspaper industry

- The Bartlane cable picture transmission service
- Images were transferred by submarine cable between London and New York
- Pictures were coded for cable transfer and reconstructed at the receiving end on a telegraph printer

Early digital image

Mid to late 1920s: Improvements to the Bartlane system resulted in higher quality images

- New reproduction processes based on photographic techniques
- Increased number of tones in reproduced images

Improved digital image

Early 15 tone digital image

**UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

1960s: Improvements in computing technology and the onset of the space race led to a surge of work in digital image processing

- 1964: Computers used to improve the quality of images of the moon taken by the *Ranger 7* probe
- Such techniques were used in other space missions including the Apollo landings

A picture of the moon taken by the *Ranger 7* probe minutes before landing

1970s: Digital image processing begins to be used in medical applications

- 1979: Sir Godfrey N. Hounsfield & Prof. Allan M. Cormack share the Nobel Prize in medicine for the invention of tomography, the technology behind Computerised Axial Tomography (CAT) scans

# Key Stages in Digital Image Processing: Image Acquisition

# Image Acquisition

- A digital image is produced by one or several image sensors, which, besides various types of light-sensitive cameras, include range sensors, tomography devices, radar, ultra-sonic cameras, etc.
- Depending on the type of sensor, the resulting image data is an ordinary 2D image, a 3D volume, or an image sequence.
- The pixel values typically correspond to light intensity in one or several spectral bands (gray images or colour images), but can also be related to various physical measures, such as depth, absorption or reflectance of sonic or electromagnetic waves, or nuclear magnetic resonance.

# Key Stages in Digital Image Processing: Image Enhancement

# Image Enhancement

- Process of manipulating an images
- Suitable for specific applications eg medical Imaging such as X-ray
- Satellite Images

# Key Stages in Digital Image Processing: Image Restoration

# Image Restoration

- Improving the appearance of an image
- Based on mathematical or probabilistic based model

- Image restoration attempts to restore images that have been degraded
- Identify the degradation process and attempt to reverse it.
- Almost Similar to image enhancement, but more objective.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

Fig: Degraded image

# Key Stages in Digital Image Processing: Morphological Processing

# Morphological Processing

- *Morphology* is a broad set of image processing operations that process images based on shapes.
- Morphological operations apply a structuring element to an input image, creating an output image of the same size.
- In a morphological operation, the value of each pixel in the output image is based on a comparison of the corresponding pixel in the input image with its neighbors.
- Step deals with tools for extracting image components those are useful in the representation and description of shape

# Basic Image Import, Processing, and Export

- Step 1: Read and Display an Image
- Read an image into the workspace, using the `imread` command.
  
- `I = imread('pout.tif');`
- `imshow(I);`

Step 2: Check How the Image Appears in the Workspace

```
whos I
```

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- Step 3: Improve Image Contrast
- View the distribution of image pixel intensities
- figure
- imhist(I)
- $I2 = \text{histeq}(I);$
- figure
- imshow(I2)
- figure
- imhist(I2)

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- Step 4: Write the Adjusted Image to a Disk File
  - Write the newly adjusted image I2 to a disk file, using the imwrite function.
- 
- `imwrite (I2, 'pout2.png');`
- 
- Step 5: Check the Contents of the Newly Written File
  - View what imwrite wrote to the disk file, using the imfinfo function.
- 
- `imfinfo('pout2.png')`

- X-rays are among the oldest sources of EM radiation used for imaging.
- Use of X-rays is medical diagnostics, and extensively in industry and other areas, like astronomy.
- X-rays for medical and industrial imaging are generated using an X-ray tube, which is a vacuum tube with a cathode and anode.
- The cathode is heated, causing free electrons to be released. These electrons flow at high speed to the positively charged anode.
- When the electrons strike a nucleus, energy is released in the form of X-ray radiation. The energy (penetrating power) of X-rays is controlled by a voltage applied across the anode, and by a current applied to the filament in the cathode.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- In digital radiography, digital images are obtained by one of two methods:
  - (1) by digitizing X-ray films; or
  - (2) by having the X-rays that pass through the patient fall directly onto devices (such as a phosphor screen) that convert X-rays to light.
- The light signal in turn is captured by a light-sensitive digitizing system.

- Angiography is another major application in an area called contrast enhancement radiography.
- This procedure is used to obtain images (called angiograms) of blood vessels.
- A catheter (a small, flexible, hollow tube) is inserted, for example, into an artery or vein in the groin.
- The catheter is threaded into the blood vessel and guided to the area to be studied.
- When the catheter reaches the site under investigation, an X-ray contrast medium is injected through the tube.
- This enhances contrast of the blood vessels and enables the radiologist to see any irregularities or blockages

# CAT

- Another important use of X-rays in medical imaging is computerized axial tomography (CAT).
- Each CAT image is a “slice” taken perpendicularly through the patient. Numerous slices are generated as the patient is moved in a longitudinal direction.
- The ensemble of such images constitutes a 3-D rendition of the inside of the body, with the longitudinal resolution being proportional to the number of slice images taken.

- Ultraviolet light is used in fluorescence microscopy, one of the fastest growing areas of microscopy.
- Fluorescence microscopy is an excellent method for studying materials that can be made to fluoresce, either in their natural form (primary fluorescence) or when treated with chemicals capable of fluorescing (secondary fluorescence).

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# IMAGING IN THE VISIBLE AND INFRARED BANDS

- The infrared band often is used in conjunction with visual imaging, so we have grouped the visible and infrared bands

Band No.	Name	Wavelength ( $\mu\text{m}$ )	Characteristics and Uses
1	Visible blue	0.45–0.52	Maximum water penetration
2	Visible green	0.53–0.61	Measures plant vigor
3	Visible red	0.63–0.69	Vegetation discrimination
4	Near infrared	0.78–0.90	Biomass and shoreline mapping
5	Middle infrared	1.55–1.75	Moisture content; soil/vegetation
6	Thermal infrared	10.4–12.5	Soil moisture; thermal mapping
7	Short-wave infrared	2.09–2.35	Mineral mapping

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- Images of population centers are used over time to assess population growth and shift patterns, pollution, and other factors affecting the environment.
- The differences between visual and infrared image features are quite noticeable in these images.

# IMAGING IN THE MICROWAVE BAND

- The principal application of imaging in the microwave band is radar.
- The unique feature of imaging radar is its ability to collect data over virtually any region at any time
- Regardless of weather or ambient lighting conditions.
- Some radar waves can penetrate clouds, and under certain conditions, can also see through vegetation, ice, and dry sand.
- In many cases, radar is the only way to explore inaccessible regions of the Earth's surface.
- An imaging radar works like a flash camera in that it provides its own illumination (microwave pulses) to illuminate an area on the ground and take a snapshot image.

- Instead of a camera lens, a radar uses an antenna and digital computer processing to record its images.
- In a radar image, one can see only the microwave energy that was reflected back toward the radar antenna.

# IMAGING IN THE RADIO BAND

- Imaging at the other end of the spectrum (gamma rays)
- The major applications of imaging in the radio band are in medicine and astronomy.
- In medicine, radio waves are used in magnetic resonance imaging (MRI).
- This technique places a patient in a powerful magnet and passes radio waves through the individual's body in short pulses.
- Each pulse causes a responding pulse of radio waves to be emitted by the patient's tissues.
- The location from which these signals originate and their strength are determined by a computer.
- Produces a two-dimensional image of a section of the patient.
- MRI can produce images in any plane.

**PRESIDENCY  
UNIVERSITY**

# Components of an Image Processing System

**PRESID  
UNIVE**

Private University Estd. in Karnataka State by Act No. 41 of 2013

FRESHMINT

# i) Image Sensors

- With reference to sensing, two elements are required to acquire digital image.
- The first is a physical device that is sensitive to the energy radiated by the object we wish to image

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## ii) Specialize image processing hardware

- – It consists of the digitizer just mentioned, plus hardware that performs other primitive operations such as an arithmetic logic unit, which performs arithmetic such addition and subtraction and logical operations in parallel on images

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

### iii) Computer

- It is a general purpose computer and can range from a PC to a supercomputer depending on the application.
- In dedicated applications, sometimes specially designed computer are used to achieve a required level of performance.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## iv) Software

- It consists of specialized modules that perform specific tasks. A well-designed package also includes capability for the user to write code, as a minimum, utilizes the specialized module.
- More sophisticated software packages allow the integration of these modules.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## v) Mass storage

- This capability is a must in image processing applications.
- An image of size 1024 x1024 pixels, in which the intensity of each pixel is an 8- bit quantity requires one megabytes of storage space if the image is not compressed.
- Image processing applications falls into three principal categories of storage
  - i) Short term storage for use during processing
  - ii) On line storage for relatively fast retrieval
  - iii) Archival storage such as magnetic tapes and disks

## vi) Image displays

- Image displays in use today are mainly color TV monitors.
- These monitors are driven by the outputs of image and graphics displays cards that are an integral part of computer system

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## vii) Hardcopy devices

- The devices for recording image includes laser printers, film cameras, heat sensitive devices inkjet units and digital units such as optical and CD ROM disk.
- Films provide the highest possible resolution, but paper is the obvious medium of choice for written applications.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## viii) Networking

- It is almost a default function in any computer system in use today because of the large amount of data inherent in image processing applications.
- The key consideration in image transmission bandwidth.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Sample Questions

- 1) Explain the applications and fields where image processing is used.
- 2) Describe the components of Image processing with neat diagram.

# Image Formation

---

First step in understanding Image formation is to known about Physical Illumination

---

Second is Reflectance Model

---

Third is The Process of Image formation at the retina of human eyes or at the sensor plane of the camera.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Human Visual Perception

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Imaging in the eye

- Variable thickness lens: thick for close focus, thin for distant focus
- Distance of focal center of the lens to the retina (14-17 mm)
- Image of a 15m tree at 100m
  - $15/100 = X/17$  or approximately 2.55 mm
- Image is almost entirely on the fovea

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# 1) Illumination

- Fundamental components of Image formation process which generates sense in our visual organs.
- The strength of Sensation which is the sensation of brightness can be quantified by averaging the responses of many human observers.
- The average response ,i.e. the psych visual sensation is determined at different spectral wavelength.
- The peak spectral sensitivity of a human observer happens at 555 nm Wavelengths

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# 1) Illumination

- Equal amounts of Luminous flux produce equal brightness, which is proportional to the logarithm of luminous flux.
- Fechner's law defines the brightness by the relation

$$B = K \log \left( \frac{F}{F_0} \right)$$

F-Luminous flux

$F_0$ -reference luminous

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## 2) Reflectance Model

- Depending on the nature reflection
- Three categories :
  1. Lambertian
  2. Specular
  3. Hybrid

# 1.Lambertian reflection

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# 1.Lambertian reflection

- Lambertian reflectance usually refers to the reflection of light by an object
- Light are reflected in all directions and diffused one
- It can be used to refer to the reflection of any wave
- The reflectance from the wall paint with flat paints, papers , fabrics, ground surface
- For example, in ultrasound imaging, "rough" tissues are said to exhibit Lambertian reflectance.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

**PRESID  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- Entire incident light in all directions covering solid angle  $2\pi$  radians
- Equally bright in all directions
- The reflectance map of Lambertian surface may be modelled as

$$I_L = E_0 A \cos \theta$$

Where  $E_0$  is the strength of the incident light source

$A$  is the surface area of the Lambertian patch

$\theta$  is the angle of Incidence

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# For an Image

- The reflectance relationship for a
- Lambertian model of image  $E(x,y)$

$$E(x,y) = A (n \cdot s)$$

- $n$  = surface normal (unit vector)
- $s$  = source direction (unit vector)
- $A$  = constant related to illumination intensity and surface

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## 2.Specular reflectance

**Specular Reflection**

**Diffuse Reflection**

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- In specular reflection a mirror surface reflects a beam of light so that the angle of reflection is equal to the angle of incidence
- Eg. the angle of the incoming light is the same as the angle of the outgoing/reflected light

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- The diagram shows how the incoming (incident) light is reflected off the mirror at the same angle to the perpendicular line (which in geometry is called the ‘normal’).

### Diagram showing the “Law of Reflection”

**The angle  $\theta_i$  is equal to the angle  $\theta_r$**

*The angle of incident light is equal to the angle of reflected light*

# References

- Tinku Acharya and Ajoy K. Ray, “*Image Processing Principles and Applications*”, John Wiley and Sons publishers.

# Image Sampling and Quantization

- The output of most of the image sensors is an analog signal, and we can not apply digital processing on it because we can not store it. We can not store it because it requires infinite memory to store a signal that can have infinite values.
- So we have to convert an analog signal into a digital signal.
- To create an image which is digital, we need to convert continuous data into digital form. There are two steps in which it is done.

- 1. Sampling**
- 2. Quantization**

- We will discuss sampling now, and quantization will be discussed later on but for now we will discuss just a little about the difference between these two and the need of these two steps.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Basic idea:

- The basic idea behind converting an analog signal to its digital signal is

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- To convert both of its axis (x,y) into a digital format.
- Since an image is continuous not just in its co-ordinates (x axis), but also in its amplitude (y axis), so the part that deals with the digitizing of co-ordinates is known as sampling.
- And the part that deals with digitizing the amplitude is known as quantization.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Sampling

- The term sampling refers to take samples
- We digitize x axis in sampling
- It is done on independent variable
- It is further divided into two parts , up sampling and down sampling

**PRESIDE  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

APU  
ASSOCIATION  
OF PRIVATE  
UNIVERSITIES  
INDIA

- If you will look at the above figure, you will see that there are some random variations in the signal.
- These variations are due to noise. In sampling we reduce this noise by taking samples.
- It is obvious that more samples we take, the quality of the image would be more better, the noise would be more removed and same happens vice versa.
- However, if you take sampling on the x axis, the signal is not converted to digital format, unless you take sampling of the y-axis too which is known as quantization.
- The more samples eventually means you are collecting more data, and in case of image, it means more pixels.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Image Sampling & Quantization

*Sampling:* Digitizing the coordinate value.

*Quantization:* Digitizing the amplitude value.

# Recall: a pixel is a point...

---

- It is NOT a box, disc or teeny wee light
- It has no dimension
- It occupies no area
- It can have a coordinate
- *More than a point, it is a SAMPLE*

# Image Sampling

---

- An image is a 2D rectilinear array of samples
  - Quantization due to limited intensity resolution
  - Sampling due to limited spatial and temporal resolution

Pixels are  
infinitely small  
point samples

# Sampling and Reconstruction

Figure 19.9 FvDFH

# Image Sampling

- A static image is a two dimensional spatially varying signal.
- A sampling period should be smaller than or at the most equal to half of the period of the finest detail in the image according to Nyquist rate.
- This implies that sampling frequency along x axis  $\omega_x \geq 2\omega_x^L$  and along y axis  $\omega_y \geq 2\omega_y^L$   
where  $\omega_x^L$  and  $\omega_y^L$  are the limiting factors along x and y axis

(a)

(b)

Fig. 2.5 (a) Rectangular and (b) hexagonal lattice structure of the sampling grid.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- $\Delta x$  is chosen sampling along x-axis then,

$$\Delta x \leq \frac{\pi}{\omega_x^L}$$

- $\Delta y$  is chosen sampling along y-axis then,

$$\Delta y \leq \frac{\pi}{\omega_y^L}$$

If  $\Delta x$  and  $\Delta y$  are smaller, it's called oversampling and  $\Delta x$  and  $\Delta y$  are larger then it is called undersampling.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- If images are oversampled or exactly sampled, it is possible to reconstruct the band limited image
- If images are undersampled , there will be spectral overlapping which results in aliasing effect
- This aliasing error can be reduced by substantially by using a presampling filter

**PRESIDENCY  
UNIVERSITY**

YEARS  
OF ACADEMIC  
WISDOM

# Image Quantization

- It is opposite side of Sampling
- As sampling is done in x-axis whereas Quantization is done on the y-axis
- Digitizing the amplitudes is called Quantization
- Quantization involves in assigning a single value to each samples
- We divide signal amplitudes into quanta(partitions)

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

Vertically ranging values have been quantized into 5 different levels or partitions.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## Relation of Quantization and gray level resolution:

*Number of quantas (partitions) = Number of gray levels*

- Number of gray levels here means number of different shades of gray.
- To improve image quality, we number of gray levels or gray level resolution up.
- If we increase this level to 256, it is known as the grayscale image.

$$L = (2^k)$$

Where,

L = gray level resolution

k = gray level

# Types of Quantization

- Uniform Quantization
- Random Quantization

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

Fig. 2.7 Two-dimensional (a) uniform quantization (b) nonuniform quantization.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- As the number of quantization levels increases, the quantized image will be approximately to the original image with less error
- When quantization levels are chosen equally spaced at equal interval, it is known Uniform Quantization
- If levels are spaced at different intervals, it is called Random Quantization or Non-uniform Quantization
- When sample intensity values are equally likely to occur at different intervals, then Uniform Quantization is followed
- If samples assume values in a small range quite frequently and other values infrequently, then Non-uniform Quantization is used

# Quantification IV

N=64

N=32

N=16

N=8

N=4

N=2

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Relationship with pixels

- Since a pixel is a smallest element in an image. The total number of pixels in an image can be calculated as  
$$\text{Pixels} = \text{total no of rows} * \text{total no of columns.}$$
- Lets say we have total of 25 pixels, that means we have a square image of 5 X 5.
- Then as we have discussed above in sampling, that more samples eventually result in more pixels. So it means that of our continuous signal, we have taken 25 samples on x axis. That refers to 25 pixels of this image.

# MCQ

- 1) 1. A continuous image is digitised at \_\_\_\_\_ points.
- a) random
  - b) vertex
  - c) contour
  - d) sampling

**PRESIDENCY

# Why are binary images special?

- Since pixels are either white or black, the locations of white(black) pixels carry ALL information of binary images

## Example

$$\begin{matrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 255 & 255 \\ 0 & 0 & 255 & 255 \end{matrix}$$

$f(m,n)$

matrix representation

$$L = \{(3,3), (3,4), (4,3), (4,4)\}$$

location of white pixels

set representation

It is often more convenient to consider the set representation than the matrix representation for binary images

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- Binary images are least expensive since it requires least storage and also less processing requirements.
- E.g line drawings, printed text in White papers
- These images have enough information about the objects in the images
- The gray images can be converted to binary using thresholding

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Image Example (Con't)

**PRESIDENCY**  
**UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

Skeleton image

- The binary image is quantified in two levels. The grey level can increased based on applications
- As number of intensity increased, we get better approximation images.
- Although the storage requirements also increases approximately

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Geometric properties of the Images

- Connectivity
- Projection
- Area
- Perimeter

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Connectivity

- A pixel  $P_0$  at  $(i_0, j_0)$  is connected to another pixel  $P_n$  at  $(i_n, j_n)$
- If and only if there exists a path from  $P_0$  to  $P_n$ , which is a sequence of points  $(i_0, j_0), (i_1, j_1) \dots, (i_n, j_n)$
- $(i_k, j_k)$  is a neighboring pixel at  $(i_{k+1}, j_{k+1})$

(c)

Fig. 2.9 Examples of (a) 4-connected pixels, (b) 8-connected pixels, and (c) connected component and background.

(a)

(b)

(c)

Figure 3.1: Definitions of (a) 8-connectedness, (b) 4-connectedness, and (c) 6-connectedness. The X's indicate which of the pixels in a 3 by 3 neighborhood may be connected to the center pixel.

- **4-connected:** When a pixel at location  $(i, j)$  has four immediate neighbors at  $(i + 1, j)$ ,  $(i - 1, j)$ ,  $(i, j + 1)$ , and  $(i, j - 1)$ , they are known as *4-connected*. Two four connected pixels share a common boundary as shown in Figure 2.9(a).
- **8-connected:** When the pixel at location  $(i, j)$  has, in addition to above four immediate neighbors, a set of four corner neighbors at  $(i + 1, j + 1)$ ,  $(i + 1, j - 1)$ ,  $(i - 1, j + 1)$ , and  $(i - 1, j - 1)$ , they are known as *8-connected*. Thus two pixels are eight neighbors if they share a common corner. This is shown in Figure 2.9(b).

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- **Connected component:** A set of connected pixels (4 or 8 connected) forms a *connected component*. Such a connected component represents an object in a scene as shown in Figure 2.9(c).
- **Background:** The set of connected components of 0 pixels forms the *background* as shown in Figure 2.9(c).

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

Once an object is identified, some of the attributes of the object may be defined as follows.

- *Area of an object:* The area of a binary object is given by

$$A = \sum_i \sum_j O[i, j],$$

where  $O[i, j]$  represents the object pixels (binary 1). The area is thus computed as the total number of object pixels in the object.

- *Location of object:* The location of the object is usually given by the center of mass and is given as

$$x_c = \frac{\sum_i \sum_j [i O(i, j)]}{A}, \quad y_c = \frac{\sum_i \sum_j [j O(i, j)]}{A}$$

where  $x_c$  and  $y_c$  are the coordinates of the centroid of the object and  $A$  is the area of the object. In effect thus the location of the object is given by the first-order moment.

Fig.3 Occluded car

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

- *Orientation of an object:* When the objects have elongated shape, the axis of elongation is the orientation of the object. The axis of elongation is a straight line so that the sum of the squared distances of all the object points from this straight line is minimum. The distance here implies the perpendicular distance from the object point to the line.
- *Perimeter of an object:* To compute the perimeter of an object, we identify the boundary object pixels covering an area. Perimeter is defined by the sum of these boundary object pixels.

# Projection of Object

- The projections of a binary image provide good information about the image
- Computed along horizontal, vertical or diagonal lines
- The horizontal projection is obtained by counting the number of object pixels in column wise
- Total no. each rows will give vertical projection

Fig. 2.10 Histogram of a binary object along horizontal and vertical axes.

# Image file formats

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# RAW (UNPROCESSED CAMERA IMAGE CAPTURING DATA)

- A camera raw image file contains minimally processed data from the image sensor of a digital camera. Raw files are named so because they are not yet processed and therefore are not ready to be printed or edited. Normally, the image is processed by a raw converter where precise adjustments can be made before conversion to a file format such as a TIFF or JPEG for storage, printing, or further manipulation. There are hundreds, of raw formats in use by different models of digital equipment.

## PROS

- Format can be used by many applications.
- File size may be smaller than TIFF.
- Saved at the camera's maximum colour bit depth.

## CONS

- Large file size means that it can take longer to save an image to the memory card, i.e. less images captured per second.
- Difficult to work with images because they need to be converted to something else (like TIFF) before they can be shared and manipulated.

# Digital master images

Three steps in the photographic process

## Image Formation

- The primary concept of image formation signify the presence of dots.
- In digital mediums these dots are often called **PIXELS** (Picture Elements) for 2-D medium or **VOXELS** (Volumetric Picture Elements ) for 3-D images.
- Pixels can be of single colour in an entire image drawing or may be of primary colours in a multi-colour drawing.
- The proximity of pixels (DPI - Dots Per Inch) and the count over a given dimension represent the Image Resolution which is the primary measure of Visual Quality of an Image.

# Why are there so many different graphic file formats?

- There are a number of fundamental different types of graphical data
  - raster data (sampled values)
  - geometry data (mathematical description of space)
  - latent image data (data transformed into useful images by some algorithmic process)

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## Types of Digital Images (Based on Drawing Units)

### ■ RASTER IMAGES:

Images made of pixels or dots.

A Raster means a frame of Screen which is made using scanning of entire screen line by line. Raster images are resolution dependent and can not be scaled up or down without loss of quality.

### ■ VECTOR IMAGES:

Images made using lines and curves that are drawn using mathematical equations. These images are not related to resolution and they can be scaled up or down to any size. While drawing on a medium vector images are also drawn using pixels, but they retain their scaling quality and redrawn again when resized.

Both Raster and Vector Images can have Colours. In case of Raster Images, colours is a pixel property while in case of Vector Images Colours are given as another mathematical property.

## Types of Digital Images (Based On Dimensions)

- **2-D IMAGES:**

Images that are seen on X and Y axis only.

- **3-D IMAGES on 2-D Medium:**

Images that are displayed on 2-D medium but still have feeling of depth associated with it. These images might require a viewer to wear special glasses to feel the 3D effect.

- **3-D IMAGES on 3-D Medium:**

Images that are produced in all 3-Dimensions of space such as 3-D holographic images, 3-D Laser Images.

- Resolution and DPI
- Colour/Bit Depth
- Compression
- Transparency
- Alpha Channels
- Gamma Correction
- Anti-Aliasing
- Interlacing
- Palletes
- Half Tone/ Duotone
- Animation Support

## Colour Depth/Bit Depth

- 2 Colour: This is mostly a black and white image. It may however be any other two colour image also. It requires just 1 bit for colour information.
- 16 Colour: These are very basic image types used on old machines. The colour information here is encoded in 4 bits only.
- 256 Color: These are 8 Bit images often used in BMP and GIF formats.
- 16 Bit: This is also known as HI-COLOR setting. These have more than 64 Thousand colours and are suitable for most picture related work on computers.
- 24 Bit: This is known as TRUE COLOR Setting. These have a better colour depth of more than 16.7 Million Colours and are visually excellent.
- 32 Bit: These have even better picture quality to show excellent picture shading effects and shades of special colours like silver, gold, colours across a glass etc. This quality is also available on modern computers.

## Image Compression.

- With the advent of faster computers the technology of reducing the image file size gained momentum.
- It is possible to reduce file size of a pixel based image to the tune of 1/10 using modern compression techniques without much loss in image quality.
- Image compression can be either completely lossless like in case of GIF and PNG standards, while in case of lossy compression even more size reduction can be achieved as in the case of JPG formats (commonly used for photographs).

112KB File Size

5.6KB File Size

Watch the minor loss of image quality near the Cat's nose.

## Image Transparency.

- Transparency is a feature of image where a certain colour of image can be replaced by the background.
- Image Transparency feature is available with certain file formats only. Most common one with transparency features are GIF, PNG and TIFF formats.
- In some formats multiple levels of transparency is supported by adding additional byte for transparency level. So instead of RGB colours it becomes RGBA colours. Here A stands for Alpha Channel. Typical example of this is the PNG file format.

White Background Colour has been made transparent in this case.

## More About Alpha Channel

- It is a way to produce partial transparency.
- This often provides perfect smoothening of edges which is otherwise difficult due to rectangular nature of pixels.
- The drop shadow effect is also correctly possible due to partial transparency feature.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Gamma Correction

- If the intensity element of image is encoded in a linear fashion then the image will not look correct. This is due to the non-linear behaviour of displays devices like CRT, LCD etc. The intensity value with respect to impulse applied does not change linearly.
- Due to this nonlinear behaviour intensity value is pre-encoded in image files itself to show it correctly on various displays.
- As an image might be displayed on different mediums and makes of computers one may need to adjust the value of this encoding for different devices. This is called **GAMMA CORRECTION**. Some image formats like PNG allow this correction in a straight forward manner.

$y=0.5$

$y=1$  (original)

$y=2$

## Anti-Aliasing

- Anti-Aliasing is a way to give a smoother perception of edges of an image.
- Anti-aliasing is done by using mathematical calculations to calculate grey shades of existing pixels or by addition/deletion of pixels near the edges.
- Microsoft's Clear-type Technology is an advanced form of anti-aliasing using colored pixels on edges.
- Anti-aliasing algorithms may be applied to full screens for better edge smoothening on the entire picture scenes. This is often done in graphics cards for better look of 3-D effect games.

Normal Edges

Anti-aliased Edges

## Interlacing

- Interlacing indicates the way an image is drawn on the screen.
- **Interlaced Image:** When the image is drawn in a way like it is done on a TV where ODD frame is drawn first and then EVEN frame is drawn, it is called an Interlaced image. In this case the whole image frame is drawn at once and then gradually the other interpolated frames are drawn to give a feel of improving quality.
- **Non-Interlaced Image:** In this type the image is drawn from top to bottom pixel by pixel and line by line. The rest portion of image looks blank. Non-Interlacing is also termed as "Progressive Scan".
- Image Formats Like GIF, JPG and TIFF support interlacing.

### Interlaced

### Non-Interlaced

## Image Palettes

- The set of colour an image is made of is called image palette.
- A typical digital image may contain an 8 bit palette (256 colours) or a set of more colours like 64K colours or 16.7 Million Colours.
- A palette based image has an advantage of changing the entire colour set in one go by just switching the palettes.
- 8-Bit BMP and GIF images are examples of palette based images.

- Half tone is a method where continuous tone perception is generated with the use of dots pitched far from regular dots density.
- Duotone is produced by superimposing another contrasting colour halftone over halftone drawing in another colour.

## Popular 2-D Digital Image Formats

**PRESIDENCY  
UNIVERSITY**

WISDOM

## BMP – Bitmap Format

Clip slide

- Used to store direct pixel colour information.
- It is mainly used on Windows family of OS.
- One of its variations is DIB (device independent bitmaps).
- It has file extensions BMP and DIB.
- Its 8 bit version can store only 256 colours.
- It creates a very large file-size as it has no major compression technique in use.
- Sometimes low compression ratio techniques like RLE (Run Length Encoding) can be used along with BMPs.
- BMP files may be zipped to reduce file sizes but still BMP format is not suitable for internet transfer.
- BMP format is however useful for standalone applications and creation of a base file that stores entire image information without any quality loss.

## GIF – Graphics Interchange Format

- This is also a pixel based format with a good image compression technique called LZW compression.
- The image quality is not reduced while using this compression.
- It supports upto 256 colours.
- It is good for images with lines, curves and solid colours.
- It is most widely supported on internet and other software.
- It can support animated images with different set of colours for each frame.
- It also supports transparency.

# GIF (GRAPHICS INTERCHANGE FORMAT)

- A GIF is a lossless file format for image files that supports both animated and static images.

## PROS

- 256 number of colours.
- Uses lossless compression.
- Support for transparency.
- Small file format.

## CONS

- The oldest format for web – 1989.
- In most cases it has a bigger file size than PNG.
- Loss of colour variation.

## JPG/JPEG – Joint Photographic Expert Group

- It has been designed under the banner of ISO (International standard Organisation) by Joint Photographic Experts Group.
- It is a highly compressed raster image format best suited for photographs.
- It allows for adjustment of degree of compression.
- It is a lossy compression. Once compressed perfect reproduction of original is impossible.
- For very little image loss 1:10 compression is often possible.
- It has an advanced version called JPEG 2000 which is still less used as it is a licensed version.
- Progressive JPGs allow multipass drawing when loaded.

Original  
1.5 MB

High  
Lossy  
Compression  
92 KB

# Compression

- **Lossless**

RLE (Run Length Encoding) – Windows bitmap files (bmp, ico)

LZW (Lempel-Ziv-Welch) – GIF & TIFF files

ZIP – TIFF files

- **Lossy**

JPEG (Joint Photographic Experts Group)

Best suited to photos and paintings of realistic scenes with smooth variations of tone and colour

# JPEG (JOINT PHOTOGRAPHIC EXPERTS GROUP)

- A JPEG is an image file format used for compressing image files. The degree of compression can be adjusted, allowing a selectable tradeoff between storage size and image quality.

## PROS

- Retains up to 16,000,000 colours.
- Suitable for images, high details & quality pictures.
- It is the most used graphic file format.
- Approved as standard in 1994.

## CONS

- It does not support transparency.
- File size larger than GIF because of colour information.

## TIFF – Tagged Image File Format

- This format was designed for images for Desktop Publishing Purposes.
- This format is often the default format in which a scanner saves the file.
- It can work as an image container along with its editing/cropping status.
- It can support compression without any loss of quality.
- It is highly recommended for archival images so that every thing can remain intact along with the image.
- It can even act as container of lossy JPEG files.
- Adobe Corp. holds the copyright of this format but for usage purpose license is not required.
- It is also useful for high precision scientific images. The other option for high precision scientific images such as astronomical images is FITS (Flexible Image Transport System)

# TIFF (TAGGED IMAGE FILE FORMAT)

- Tagged Image File Format (TIFF) is a computer file format for storing raster images, popular among the publishing industry and photographers. The TIFF format is widely supported by image manipulation applications and publishing and page layout applications.

## PROS

- No image data is lost.
- Better image quality than even the JPEG fine quality.
- Good for images that will be heavily manipulated in a photo editing program.

## CONS

- File size is very large.
- Still need to make sure that exposure, white balance and colour saturation are properly set because fixing these in the photo editing program will degrade the image to a certain degree.

Extension	Colour	Compression	Common Uses
JPG, JPEG	24-bit	Lossy	Photos, web pics
GIF	8-bit	Lossless	Web graphics – buttons, icons, etc
PNG	up to 24-bit	Lossless	Web – replacement for GIF
TIF, TIFF	24-bit	Lossless	Professional Photos etc

## PSD – Photoshop Document

- It is a application specific proprietary format for Adobe Photoshop.
- Application specific formats support layered image storage, editing marks, clipping, padding and position storage.
- It supports colour modes like RGB, CMYK, LAB, GREY, PALLETED etc.
- It supports unlimited colours.
- It produces native bitmap format with RLE compression.

# VECTOR FORMATS

## WMF/EMF – Windows Metafile/Enhanced Meta File

- It can store both vector and bitmap components.
- It is the native format for applications like Word, Power-point, Publisher etc.
- The EMF enhancement has commands for printer graphics also.
- WMF/EMF have direct function calls for windows GDI – Graphics Device Interface.
- WMF produces very small size files and is quite suitable for usage in form of clipart libraries.
- WMZ and EMZ are compressed formats of WMF and EMF respectively.

- It is native Vector Based Format for Corel Applications.
- It has capability to store both vector based and bitmap images.
- It can store multiple pages of data.
- It stores all editing status and other image configuration data.
- It produces an extremely low file size.
- Every Version of CorelDraw has different formats and it is essentially required to convert files to a lower version while transferring to previous version of Corel Application.

## EPS – Encapsulated Postscript

- This format is frequently used for production quality drawing in printing.
- This is a vector based format that can contain PostScript Style Description of Drawing.
- Its purpose is for printing only and EPS files are not meant for Editing.
- Converted EPS files may only be viewed by special viewers. Regular graphics applications are not able to open these file.

**UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# PPM-Portable Pixmap Image

- A PPM file is a 24-bit color image formatted using a text format.
- It stores each pixel with a number from 0 to 65536, which specifies the color of the pixel.
- PPM files also store the image height and width, whitespace data, and the maximum color value.
- Either P3(ASCII form) or P6(Binary form)

UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# PGM

- A **PGM** file is a grayscale **image** file saved in the portable gray map (**PGM**) format and encoded with one or two bytes (8 or 16 bits) per pixel.
- It contains header information and a grid of numbers that represent different shades of gray from black (0) to white (up to 65,536)

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# PBM

- A file with the PBM file extension is mostly likely a Portable Bitmap Image file.
- These files are text-based, black and white image files that contain either a 1 for a black pixel or a 0 for a white pixel.

## OTHER FORMATS

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## ICO - ICON

- It is a file format for Windows Icons.
- One can produce 16x16 16 colour icon to 48x48 16.7 Million Colour Icons using this format.
- Technically ICO file can even store a 1x1 pixel image.
- Vista and above supports even the 256x256 pixel icons.
- Modern systems also supports PNG files to be used as icons.
- One may require to use a special pixels based editor to create icons.

## SVG – Scalable Vector Graphics

- It is a modern XML based file for vector graphics, that can be used on internet also.
- It is an standard from W3C (World Wide Web Consortium) that created standards for HTML, XML etc.
- It supports standard compression techniques and is saved as SVGZ when compressed.
- It supports dynamic, interactive drawing using Javascript.
- It supports Vector Graphics, Raster Graphics and Normal Text.

# Image Enhancement Definition

- **Image Enhancement:** is the process that improves the quality of the image for a specific application

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Image Enhancement Methods

- **Spatial Domain Methods (Image Plane)**

Techniques are based on direct manipulation of pixels in an image

- **Frequency Domain Methods**

Techniques are based on modifying the Fourier transform of the image.

- **Combination Methods**

There are some enhancement techniques based on various combinations of methods from the first two categories

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Spatial Domain Methods

- As indicated previously, the term *spatial domain* refers to the aggregate of pixels composing an image. Spatial domain methods are procedures that operate directly on these pixels. Spatial domain processes will be denoted by the expression:

$$g(x,y) = \mathbf{T} [f(x,y)]$$

Where  $f(x,y)$  in the input image,  $g(x,y)$  is the processed image and  $\mathbf{T}$  is an operator on  $f$ , defined over some neighborhood of  $(x,y)$

- In addition,  $\mathbf{T}$  can operate on a set of input images.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

**FIGURE 3.1 A**  
 $3 \times 3$   
neighborhood  
about a point  
( $x, y$ ) in an image.

- The simplest form of  $T$ , is when the neighborhood of size  $1 \times 1$  (that is a single pixel). In this case,  $g$  depends only on the value of  $f$  at  $(x,y)$ , and  $T$  becomes a *grey-level* (also called *intensity* or *mapping*) *transformation function* of the form:

$$s = T(r)$$

Where, for simplicity in notation,  $r$  and  $s$  are variables denoting, respectively, the grey level of  $f(x,y)$  and  $g(x,y)$  at any point  $(x,y)$

# Examples of Enhancement Techniques

- **Contrast Stretching:**

If  $T(r)$  has the form as shown in the figure below, the effect of applying the transformation to every pixel of  $f$  to generate the corresponding pixels in  $g$  would:

Produce higher contrast than the original image, by:

- Darkening the levels below  $m$  in the original image
- Brightening the levels above  $m$  in the original image

So, Contrast Stretching: is a simple image enhancement technique that improves the contrast in an image by ‘stretching’ the range of intensity values it contains to span a desired range of values. Typically, it uses a linear function

# Examples of Enhancement Techniques

- **Thresholding**

Is a limited case of contrast stretching, it produces a two-level (binary) image.

Some fairly simple, yet powerful, processing approaches can be formulated with grey-level transformations. Because enhancement at any point in an image depends only on the gray level at that point, techniques in this category often are referred to as *point processing*.

# Examples of Enhancement Techniques

Larger neighborhoods allow considerable more flexibility. The general approach is to use a function of the values of  $f$  in a predefined neighborhood of  $(x,y)$  to determine the value of  $g$  at  $(x,y)$ .

One of the principal approaches in this formulation is based on the use of so-called *masks* (also referred to as *filters*)

So, a **mask/filter**: is a small (say 3X3) 2-D array, such as the one shown in the figure, in which the values of the mask coefficients determine the nature of the process, such as *image sharpening*.

Enhancement techniques based on this type of approach often are referred to as

*mask processing* or *filtering*.

# Some Basic Intensity (Gray-level) Transformation Functions

- Grey-level transformation functions (also called, intensity functions), are considered the simplest of all image enhancement techniques.
- The value of pixels, before and after processing, will be denoted by  $r$  and  $s$ , respectively. These values are related by the expression of the form:

$$s = T(r)$$

where  $T$  is a transformation that maps a pixel value  $r$  into a pixel value  $s$ .

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Some Basic Intensity (Gray-level) Transformation Functions

Consider the following figure, which shows three basic types of functions used frequently for image enhancement:

**FIGURE 3.3** Some basic gray-level transformation functions used for image enhancement.

# Some Basic Intensity (Gray-level) Transformation Functions

- The three basic types of functions used frequently for image enhancement:
  - Linear Functions:
    - Negative Transformation
    - Identity Transformation
  - Logarithmic Functions:
    - Log Transformation
    - Inverse-log Transformation
  - Power-Law Functions:
    - $n^{\text{th}}$  power transformation
    - $n^{\text{th}}$  root transformation

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Linear Functions

- **Identity Function**

- Output intensities are identical to input intensities
- This function doesn't have an effect on an image, it was included in the graph only for completeness
- Its expression:

$$\mathbf{s} = \mathbf{r}$$

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Linear Functions

- **Image Negatives (Negative Transformation)**

- The negative of an image with gray level in the range  $[0, L-1]$ , where  $L$  = Largest value in an image, is obtained by using the negative transformation's expression:

$$s = L - 1 - r$$

Which reverses the intensity levels of an input image, in this manner produces the equivalent of a photographic negative.

- The negative transformation is suitable for enhancing white or gray detail embedded in dark regions of an image, especially when the black area are dominant in size

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## NEGATIVE TRANSFORMATION EXAMPLE

# Image Negative

Original Image

Image negative

Image Negative:  $s = L - 1 - r$

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Logarithmic Transformations

- **Log Transformation**

The general form of the log transformation:

$$s = c \log (1+r)$$

Where  $c$  is a constant, and  $r \geq 0$

- Log curve maps a narrow range of low gray-level values in the input image into a wider range of the output levels.
- Used to expand the values of dark pixels in an image while compressing the higher-level values.
- It compresses the dynamic range of images with large variations in pixel values.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Logarithmic Transformations

# Logarithmic Transformations

- **Inverse Logarithm Transformation**

- Do opposite to the log transformations
- Used to expand the values of high pixels in an image while compressing the darker-level values.

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

## LOG TRANSFORMATION EXAMPLE

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Power-Law Transformations

- Power-law transformations have the basic form of:

$$\mathbf{S} = \mathbf{c.r}^{\gamma}$$

Where  $c$  and  $\gamma$  are positive constants

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Power-Law Transformations

- Different transformation curves are obtained by varying  $\gamma$  (gamma)

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Power-Law Transformations

- Variety of devices used for image capture, printing and display respond according to a power law. The process used to correct this power-law response phenomena is called **gamma correction**.

For example, cathode ray tube (CRT) devices have an intensity-to-voltage response that is a power function, with exponents varying from approximately 1.8 to 2.5. With reference to the curve for  $g=2.5$  in Fig. 3.6, we see that such display systems would tend to produce images that are darker than intended. This effect is illustrated in Fig. 3.7. Figure 3.7(a) shows a simple gray-scale linear wedge input into a CRT monitor. As expected, the output of the monitor appears darker than the input, as shown in Fig. 3.7(b). Gamma correction

in this case is straightforward. All we need to do is preprocess the input image before inputting it into the monitor by performing the transformation. The result is shown in Fig. 3.7(c). When input into the same monitor, this gamma-corrected input produces an output that is close in appearance to the original image, as shown in Fig. 3.7(d).

# Power-Law Transformation

# Power-Law Transformation

- In addition to gamma correction, power-law transformations are useful for general-purpose contrast manipulation.

# Piecewise-Linear Transformation Functions

- **Principle Advantage:** Some important transformations can be formulated only as a piecewise function.
- **Principle Disadvantage:** Their specification requires more user input than previous transformations
- **Types of Piecewise transformations are:**
  - Contrast Stretching
  - Gray-level Slicing
  - Bit-plane slicing

**PRESIDENCY  
UNIVERSITY**

Private University Estd. in Karnataka State by Act No. 41 of 2013

# Contrast Stretching

- One of the simplest piecewise linear functions is a contrast-stretching transformation, which is used to enhance the low contrast images.
- Low contrast images may result from:
  - Poor illumination
  - Wrong setting of lens aperture during image acquisition.

# Contrast Stretching

- Figure 3.10(a) shows a typical transformation used for contrast stretching. The locations of points  $(r_1, s_1)$  and  $(r_2, s_2)$  control the shape of the transformation function.
- If  $r_1 = s_1$  and  $r_2 = s_2$ , the transformation is a linear function that produces no changes in gray levels.
- If  $r_1 = r_2$ ,  $s_1 = 0$  and  $s_2 = L-1$ , the transformation becomes a *thresholding function* that creates a binary image.
- Intermediate values of  $(r_1, s_1)$  and  $(r_2, s_2)$  produce various degrees of spread in the gray levels of the output image, thus affecting its contrast.
- In general,  $r_1 \leq r_2$  and  $s_1 \leq s_2$  is assumed, so the function is always increasing.

# Contrast Stretching

- Figure 3.10(b) shows an 8-bit image with low contrast.
- Fig. 3.10(c) shows the result of contrast stretching, obtained by setting  $(r_1, s_1) = (r_{\min}, 0)$  and  $(r_2, s_2) = (r_{\max}, L-1)$  where  $r_{\min}$  and  $r_{\max}$  denote the minimum and maximum gray levels in the image, respectively. Thus, the transformation function stretched the levels linearly from their original range to the full range  $[0, L-1]$ .
- Finally, Fig. 3.10(d) shows the result of using the *thresholding function* defined previously, with  $r_1=r_2=m$ , the mean gray level in the image.

# Gray-level Slicing

- This technique is used to highlight a specific range of gray levels in a given image. It can be implemented in several ways, but the two basic themes are:
  - One approach is to display a high value for all gray levels in the range of interest and a low value for all other gray levels. This transformation, shown in Fig 3.11 (a), produces a binary image.
  - The second approach, based on the transformation shown in Fig 3.11 (b), brightens the desired range of gray levels but preserves gray levels unchanged.
  - Fig 3.11 (c) shows a gray scale image, and fig 3.11 (d) shows the result of using the transformation in Fig 3.11 (a).

# Gray-level Slicing

**Input image**

**Output image**

# Bit-plane Slicing

- Pixels are digital numbers, each one composed of bits. Instead of highlighting gray-level range, we could highlight the contribution made by each bit.
- This method is useful and used in image compression.

- Most significant bits contain the majority of visually significant data.
